

Your Trading History, Audited

Sample report: a real prop-firm account, September 1 to October 2, 2026 (her own bars, updated Oct 4)

This is the report a buyer receives, built from a real NinjaTrader export plus her own 1-minute bars from the same platform. The trader is my partner; she agreed to share this one account (ending ...0014). Every number below comes from her fills. Nothing is a projection.

What this is: a description of what *you* did, in your own numbers. What it is not: trading advice, a signal, or a prediction. Where the data can't tell, the report says so.

1. The month on one page

Entries	293 over 23 trading days
Instruments	MNQ (most), MES, MGC, a few MCL/NQ/GC
Win rate	64.2%
Net after commissions	+\$1,832.87
Usual size	1 contract (MNQ), with occasional 10- and 20-lot "warm-up" trades
Median winner, MNQ	+7.88 points, held 4.7 minutes
Median loser, MNQ	-11.75 points, held 7.4 minutes

Read that last pair twice. The winners are taken faster and smaller than the losers. That one line explains more of the month than any indicator.

2. When you trade, in market time

Your PC is in Korea. 13:00 on your screen is midnight in New York. Every window below is a New York session, with your local hours beside it.

New York session (your local hours)	Trades	Win rate	Net
NY open, 09:30-12:00 (22:30-01:00)	71	63.4%	+\$8.11
NY afternoon, 12:00-16:00 (01:00-05:00)	114	64.9%	+\$1,167.35
NY overnight, 23:00-02:00 (12:00-15:00)	17	47.1%	-\$306.01

Almost none of the regular-session money came before noon in New York, and the overnight window, when you trade in the Korean afternoon, is the only one that lost. You said afterwards: "Right after the open it's so volatile you can't call it. Still, \$8 is kind of a shock."

3. Your first trades of the day

	Trades	Win rate	Net
Entries 1-5 each day	92	55.4%	-\$327.38
Entry 6 onward	201	68.2%	+\$2,160.25

You called the first few "test trades to feel out the session." The numbers agree: they cost about \$330 for the month, and everything you kept came after them.

4. After a loss

Two different questions here, and they have different answers.

Does a loss make the next trade worse? No. Right after a losing exit you won 65.2% (92 trades, +\$1,217.08), the same as your overall rate. (My first version said 50%, because it let each trade peek at a result that hadn't closed yet. The fixed number is the one above.)

Does re-entering *quickly* after a loss cost money? Yes.

Next entry after a losing exit	Trades	Net
Within 15 minutes	50	-\$178.65
After 15 minutes or more	42	+\$1,395.92

This is where your "pause after a loss" rule came from. You didn't have one written down before this report.

5. Size

Your usual MNQ size is 1 contract. Twice on October 1 you entered 10 (MGC) and 20 (MNQ) contracts, each in and out within a minute, both inside 15 minutes of a losing exit. You call these warm-ups. Flagging them is a question, not a verdict, but on a prop account the max-size rule is the one that ends the account, so the watch tool flags any entry more than 3x your usual size.

On the same day you added to a losing MNQ short twice, at -30.25 and -33.25 points from your average. All four of those contracts closed at a loss: **-\$273.16** together.

6. How you exit

Your exits are the strongest part of the record, and I checked that the hard way.

I replayed all 293 of your entries on your own 1-minute bars with fixed take-profit/stop brackets, picked the best bracket on your older 205 trades, and scored it on your newer 88 trades it had never seen.

- Best bracket in-sample: target and stop at 3x your usual move (± 26.25 MNQ points). It "made" \$2,447.01 on those trades to your \$1,561.51. That's what fitting does.
- Out of sample, that bracket made **+\$444.86**. **Your own exits made +\$271.36** on the same 88 trades. Counting bars that touched both levels either way gives the same answer.
- In the 30 minutes after an MNQ entry, price typically went 22.75 points your way and 20.5 against (medians, 229 entries). A stop at half your usual move (4.5 points) sits inside that noise and lost with every target.

So on this month, a wide symmetric bracket would have done better than your hand exits, by about \$170 on 88 trades. That is one month and one bracket; I'd want to see it hold on the next export before you change anything. (On public Yahoo bars, which covered only 233 of these entries, the same test came out the other way. Your own bars are the ones to trust.)

7. Your written rules vs. your trades

You gave me your rules in writing. I checked each one against the chart as it was at the moment of each click (no look-ahead: 15-minute bars that hadn't closed yet don't count).

Rule	Followed	Trades	Win rate	Net
Trade with the 15-min 200 trend	yes	82	67.1%	+\$450.08
	no	161	57.1%	+\$520.31
Trade with the 5-min 100 EMA	yes	93	62.4%	+\$359.42
	no	200	65.0%	+\$1,473.45
Don't chase price > 1 sd from VWAP	yes	274	63.1%	+\$1,788.24
	no	19	78.9%	+\$44.63 (small sample)

Two things stand out. The 15-minute trend rule is the one you break most often (161 of 243 trades against it). With it you win 67%; against it 57%. You still made money against it because you took twice as many trades that way, but ten points of win rate is a real gap. The 5-minute EMA rule makes no difference in your record (62% with, 65% against); you may be spending attention on it for nothing.

By distance from VWAP, fading a stretch of 1-2 standard deviations was your best setup: 87 trades, 71%, +\$1,166.02. Fading inside the first band was your weakest: 56 trades, 54%, -\$42.75. Chasing inside the first band (82 trades, 60%, +\$199.42) was fine.

You also noted "spots worth 200+ ticks." None of your 138 MNQ winners reached 200 ticks; the median winner was 31.5 ticks. The spots may exist. You didn't hold through any of them.

8. What the data can't tell you

I trained a model (TabPFN) on your older trades to see if it could pick your winners from your losers on newer ones. Four time blocks, AUC 0.42, 0.52, 0.48, 0.55. That's a coin flip. Your history can't predict your next trade, and anyone who sells you a report saying it can is selling you the look-ahead bug from section 4.

9. Three things your own numbers point at

Not advice. Your record, summarized.

1. Your first five entries cost you the month's worst line, and you already treat them as tests. The cheapest version of a test trade is the smallest size you're allowed.
2. The 15 minutes after a losing exit are the only window in your record where waiting had a clear price tag: about \$1,570 between the two rows in section 4.
3. The 15-minute trend rule is worth keeping for the win rate; the 5-minute EMA rule isn't showing up anywhere in your results. And the exit replay says a wide fixed bracket beat your hand exits this month, which is worth testing again on next month's export before acting on it.

How this report is made

You export Trades and minute bars from NinjaTrader and send the files. I run them through [tilt-check](#), an open-source tool I wrote for exactly this, check every number against your fills (all 293 of hers sat inside the bar they were filled in), and write the report in plain English within 48 hours. Your files are deleted after delivery. If it's late, you get a full refund.
